# Weekly summary of the week 14

## This article was generated by the weekly summary script(11/04/2023)

Docker has introduced several new features and updates to its platform. One of the most notable updates is the release of Docker Scout 4.18, which adds new features, including vulnerability queries, process build attestations for images using BuildKit, and a "docker scout recommendations" command that suggests updates. Additionally, Docker Desktop 4.18 introduces image comparison, which allows users to document vulnerabilities and make improvements. Docker Container File Explorer has also been released, which allows users to view, edit and delete files within Docker containers.

In the latest update, Docker Compose has added a watch mode to monitor file edits and automatically sync them. Additionally, Docker is seeking feedback on updates for File Watch, which will offer improved functionality for Docker Compose. Docker has also introduced a CLI command, `docker init`, that quickly adds Docker to your environment. Finally, users can submit feedback, requests for framework/language support, and provide suggestions by navigating to the Images tab in Docker Desktop and selecting "Give Feedback."
